

Brand guide

Colour, mark, shape and voice — and the one rule that keeps the product honest.

Version 1.4.0 · generated 20 September 2026 from the source files that define these values. The code is the source of truth; regenerate with `node scripts/make-brand-guide.mjs`.

THE ONE RULE

The brand colour and the data colours are separate systems.
Neither may borrow from the other.

A colour on a chart is a claim about which measurement you are looking at. If the app's chrome uses the same colour, the claim stops being trustworthy.

This has already gone wrong once. Until version 1.4.0 the accent was #818cf8 — and so was the Mood domain. The same hex, in 71 places: one meant Mood, seventy meant "this is a button".

Reaching for a colour to identify a **measurement**? `src/lib/domains.ts`. For a **control, link or surface**? `src/constants/brand.ts`. An unrecognised factor takes the neutral #8892a4 and must never fall back to the brand.

THE MARK

An **S** cut from a gradient of the domain colours: the mark is literally made of the palette the app measures with. Do not flatten it, re-order the stops, or recolour it for a campaign.

CONTEXT	TILE	GLYPH FILLS
In-app lockup	#0B2B2A	41%
Launcher icon	#0F6E56	58%
Android adaptive foreground	transparent	50%, inside the safe zone
Splash	transparent	88%

Two tiles on purpose: in-app the mark sits on a near-black screen, where a near-black tile is right. A home screen is not that — an almost-black icon disappears on a dark wallpaper. Every icon is generated from the component by `scripts/make-icons.mjs`. Regenerate, never redraw.

BRAND COLOUR

Teal, and specifically #0F6E56 — the same ink the PDF report already uses to mean "improved", so the app and the document it produces are one brand rather than two.

fill

#0F6E56

Primary button, under a white label.

on #0a0c12 **3.2:1** white on it **6.2:1** nearest data **ΔE 42**

solid

Gradient partner and secondary fills.

on #0a0c12 **4.5:1** white on it **4.3:1** nearest data **ΔE 34**

textSoft

#99E6DB

Larger or lower-emphasis accent text.

on #0a0c12 **13.7:1** white on it **1.4:1** nearest data **ΔE 34**

textFlat

#3FB8A8

Settings accents, a touch flatter.

on #0a0c12 **8.0:1** white on it **2.4:1** nearest data **ΔE 26**

Symetric brand guide

1.4.0

BRAND COLOUR, CONTINUED

	border #1A5C4E Accent card borders. on #0a0c12 2.5:1 white on it 7.8:1 nearest data ΔE 39
	surface #0B1A1B Accent card backgrounds. on #0a0c12 1.1:1 white on it 17.8:1 nearest data ΔE 57
	signIn #0F7A60 The sign-in button, historically its own shade. on #0a0c12 3.7:1 white on it 5.3:1 nearest data ΔE 37
	tile #0B2B2A The in-app logo tile. on #0a0c12 1.3:1 white on it 15.1:1 nearest data ΔE 51

IN PLACE

WASHES

Translucent accents go through `brandTint(BRAND.x, alpha)`. Never hand-write `rgba(...)`: forty-three of those were the reason the last colour change could not be done with search and replace, because raw channel numbers have no textual link to the colour they are a tint of.

DATA COLOUR — MIND DOMAINS

These identify measurements. They are not brand colours and change only if the meaning changes.

 mood #818CF8	 energy #34D399
 anxiety #FB923C	 concentration #38BDF8
 irritability #F472B6	 social battery #A78BFA
 sensory sensitivity #FBBF24	 motivation #C084FC
 sleep #7B9EB8	

DATA COLOUR — BODY, AND THE NEUTRAL

 all body domains #BC812F	 unknown factor #8892A4
--	--

Every body domain shares one colour, because body domains are read as a group against mind.

ADDING A DOMAIN COLOUR

Check it against the brand tokens *and* every existing domain using perceptual distance, not hue. Under **ΔE 15** is confusable at a glance. Hue alone will mislead you: a dark teal and a bright mint are 17° apart and never mistaken for each other.

For reference, the current brand fill sits ΔE 42 from the nearest data colour (sleep), and the link text ΔE 27 from energy.

COMFORT MODE

A muted version of the same hue, for users who find the normal accent too loud. Derived from the brand — if the brand moves, these move with it.

 comfort fill #2F5450	 comfort text #9FC3BB
 comfort border #1E3330	

PRINT COLOUR

The PDF report has its own palette and does not use the app's tokens. **A screen colour chosen for a near-black background can be invisible on white** — the brand's #4FD1C5 manages 1.9:1 there.

ink
#1F2937

muted
#6B7280

rules
#D1D0C8

teal — improved
#0F6E56

coral — concerning
#A32D2D

amber — watch
#854F0B

SHAPE

8pt Chips, pills, tabs, filter controls, buttons

12pt Standard cards and inputs

16–24pt Hero cards and modals

Circles Stay circles: PIN keypad, comfort button, icon badges

Controls were capsule-shaped until 1.4.0. Eight reads as a control rather than a tag, and echoes the cards behind it.

TYPOGRAPHY

There is no brand typeface, and this is a known gap. The app uses each platform's system font. The report asks for Roboto, "Noto Sans", Helvetica, Arial — Roboto first so Android's substitution is deliberate rather than accidental.

This matters more than it sounds: Android has neither Helvetica nor Arial, and the same report paginated differently on the two platforms — five of eleven pages overflowed under an Android-like font while all eleven fitted under Helvetica. Page budgets are fitted to the wider of the two. Adding a typeface means re-running `scripts/report-layout/`.

VOICE

Calm, plain-spoken, low-hype. No exclamation points, no emoji, no empowerment language. Speaks like a competent friend, not a wellness brand. Sentences say what will happen — "takes about 20 seconds each time" — rather than selling a feeling.

Do • Say what was measured, and over how many days • Let a null result be a result • Treat a baseline as typical for that person	Don't • Imply cause from correlation • Call a baseline "fine" or "normal" • Congratulate someone on their symptoms
---	---

The audience is managing a chronic illness, has often been dismissed for years, and has been sold to enough.

ACCESSIBILITY

Floors: **4.5:1** for body text, **3:1** for large or bold. Every brand token meets them in the direction it is used. Colour is never the only signal — charts carry labels and numbers, findings carry a confidence word as well as a tier colour.

PAIRING	RATIO
White on brand fill	6.2:1
Brand text on app background	10.5:1
White on comfort fill	8.4:1
Comfort text on app background	10.2:1

NOT SETTLED

- **No brand typeface.** The largest open question here.
- **Store screenshots** — 17 artboards still show the old accent and the placeholder icon.
- **The report's mind-line ink** is thin on white.
- **Voice** is documented but inferred from in-product copy, not confirmed.
